

Proxies

Premiere Pro

Settings

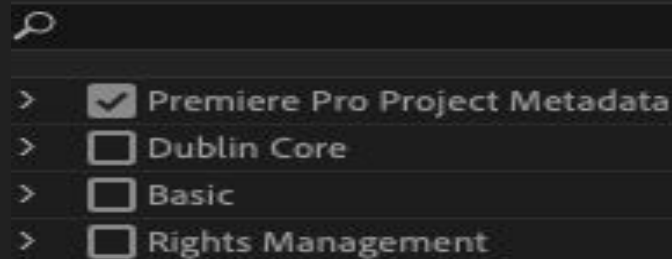

- Copy and create a folder for your master Clips on your editing drive
- Create a folder for your PR project and proxies
- Launch Premiere
- Create new project
- Name your project and choose the folder location for your project
- Choose scratch disk if different from project
- Select ingest settings and click ingest
- Select the tab to create proxies and choose preset to select the proxy resolution
- Select proxy destination and select your proxy folder

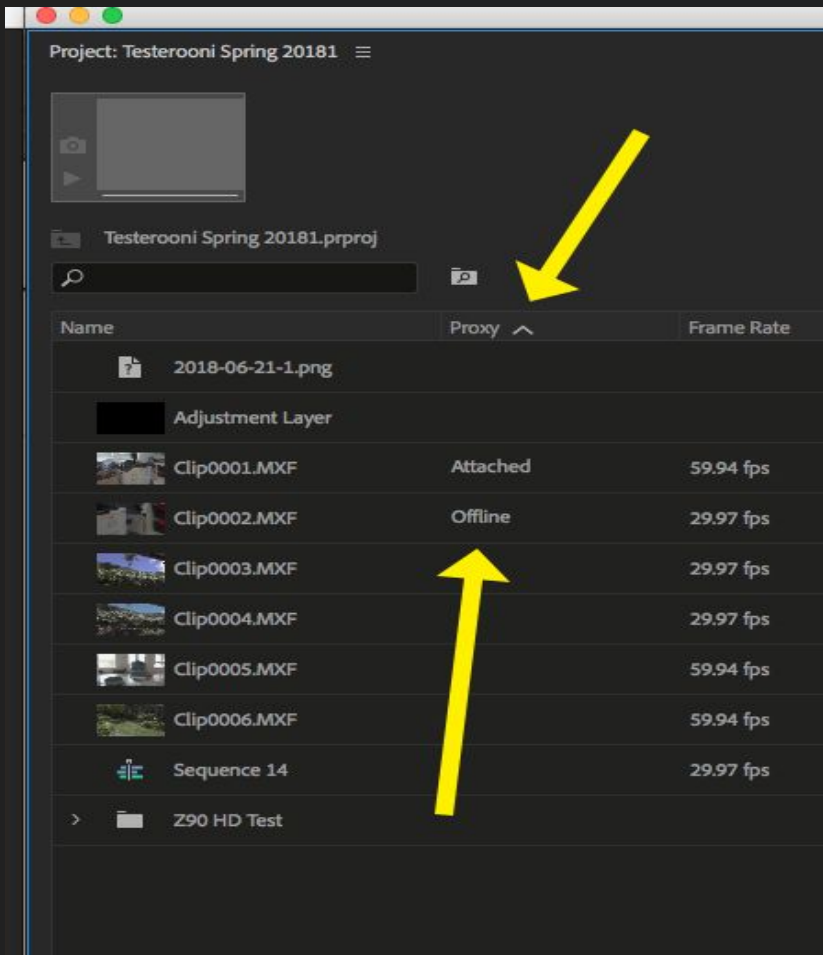

Create proxies

- Create a new bin for your master files and rename your bin
- Locate the Media Browser and find the master clips
- Drag clips into the master clip bin

✓ Media encoder will open and create the proxy clips to your proxy folder

✓ To verify the proxies check the metadata display settings

Toggle proxies off and on
